WHATSNEXT VISION MOTORS: A SALESFORCE-DRIVEN AUTOMOTIVE ORDER MANAGEMENT SYSTEM

---

1. Understand the Goal

You need to build a **Salesforce Order Management System (OMS)** for *WhatsNext Vision Motors* that:

- Automates vehicle order processing
- Tracks vehicle stock in real-time
- Improves customer experience
- Assigns nearest dealers automatically
- Ensures data security
- Provides reports and dashboards for analysis

---

2. Design the Data Model (VERY IMPORTANT)

Core Objects

- Customer (Account / Contact)
- Vehicle
- Order
- Order Line Item
- Inventory
- Dealer

Relationships

- One Customer → Many Orders
- One Order → Many Order Line Items
- One Vehicle → Many Inventory Records
- One Dealer → Many Orders

Example Fields

Order Object

- Order ID
- Order Status
- Total Amount

Order Line Item

- Vehicle
- Quantity
- Price

---

3. Create Fields

Order Object

- Order Status (Picklist: New, Pending, Confirmed, Delivered)
- Order Date
- Total Amount (Formula)

Inventory Object

- Stock Available
- Reorder Level
- Last Updated

---

4. Formula Fields

Use formulas for automation:

- **Total Amount**
  → Quantity × Price
- **Stock Status**
  → IF(Stock_Available > 0, "Available", "Out of Stock")

---

5. Validation Rules

Prevent invalid data:

- Quantity ≤ 0 → Show Error: *"Quantity must be greater than zero"*
- Prevent order if stock is 0

---

6. Automation (Flow / Process Builder)

When Order is Created

- Assign nearest dealer automatically
- Send confirmation email
- Create task for processing

When Order Status = Confirmed

- Reduce vehicle stock automatically

When Stock is Low

- Send alert to admin

---

7. Apex (IMPORTANT)

Use Apex for complex logic:

Apex Trigger Example

- Trigger on Order → validate stock & assign dealer

Pseudo Logic:

```
for(Order o : Trigger.new){
  if(o.Vehicle_Stock__c > 0){
      o.Status = 'Confirmed';
  } else {
      o.Status = 'Pending';
  }
}
```

Apex Class

- Handles dealer assignment
- Updates inventory
- Sends notifications

Test Class

- Ensure minimum 75% code coverage

---

8. Security (VERY IMPORTANT)

Profiles & Roles

- Admin
- Sales User
- Dealer Manager

Field-Level Security

- Restrict pricing or sensitive data

Sharing Rules

- Only assigned dealers can view orders

---

9. User Management

- Create users
- Assign roles
- Assign profiles

---

10. Reports & Dashboards

Reports

- Orders by Status
- Vehicle Stock Levels
- Pending Orders
- Low Stock Vehicles

Dashboard

- Total Orders
- Confirmed Orders

- Pending Orders
- Stock Alerts

---

11. Integration (Basic Level)

- Email notifications
- Customer support case creation

---

12. Final Use Case Flow (VERY IMPORTANT)

👉 You MUST explain like this:

Customer places vehicle order
→ Order created in Salesforce
→ Nearest dealer assigned automatically
→ Stock checked

→ If stock available → Order Confirmed
→ If stock not available → Order Pending

→ Inventory updated
→ Notification sent to customer
→ Customer can track order status
→ Reports and dashboard updated

---

13. What You Should Submit

Your project must include:

- Data Model Diagram
- Objects & Fields List
- Flow / Process Automation
- Apex Code + Test Class
- Security Setup
- Reports & Dashboard
- Use Case Explanation
- Demo Link
- GitHub Repository
